The research activities of the LARSyS are organized in five thematic areas: A-Complex Systems in Engineering and Fundamental Sciences; B-Sustainable Urban Systems and Technologies; C-Sustainable Energy, Environment, and Economic Development; D-Ocean Systems Technology; and E-Ocean Resources and Ecosystems. These, in turn, are supported scientifically by the eleven research groups that compose the LARSyS: IMAR-Centre of IMAR of the University of the Azores; CREMINER- Centre of Mineral Resources, Mineralogy, and Crystallography of the University of Lisbon; LEES-Laboratory for Energy and Environmental Studies of the Center for Innovation, Technology and Policy Research at Instituto Superior Técnico (IN /IST); LTPM-Laboratory of Technology Policy, and Management of Technology of IN /IST; LTCES-Laboratory of Thermofluids, Combustion and Energy Systems of IN /IST; DSOR - Dynamical Systems and Ocean Robotics Laboratory of the Institute for Systems and Robotics at IST (ISR/IST); ESBE-Evolutionary Systems and Biomedical Engineering of ISR/IST; IRS-Intelligent Robots and Systems of ISR/IST; SIPG-Signal and Image Processing Group of ISR/IST; VisLab - Computer and Robot Vision Laboratory of ISR/IST; and CAMGSD-Center for Mathematical Analysis, Geometry and Dynamical Systems of IST. Thematic area A addresses challenging theoretical problems in a number of topics that include: Nonlinear Systems and Optimization problems, motivated by engineering applications in control, estimation, and decision theory that are the core of important research activity pursued at the DSOR, SIPG, and VisLab; Fluid Dynamics and Turbulence, particularly in chaos and turbulence problems, also addressed by LTCES; and Mathematical Methods for Fundamental Science and Engineering, involving modern techniques of algebraic, differential, and symplectic geometry, and nonlinear differential equations with a view to applications such as signal and image processing on manifolds, in strong collaboration with the SIPG and VisLab. Random matrix theory also encompasses a set of powerful tools, which are key to the design of modern engineering systems. Thematic area B provides a comprehensive approach to R&D focused on the following topics: Surveillance and Activity Monitoring; Urban Metabolism: Natural resources usage in economic activities; Networked Robot Systems; Human- Environment Interaction; and Distributed Inference in Sensor Networks and Environmental Surveying. The contributions from these broad areas will provide the diversity and richness that foster cooperation across research groups and visionary multidisciplinary research. Thematic area C is intended to undertake multidisciplinary research aiming at developing complex engineering systems and technologies to promote sustainability, namely in terms of the needs to secure socio-economic development and the quality of the environment, creating a more prosperous and sustainable society. In this context, enabling technologies are developed and assessed under a systems view, comprising the use and environmental implications of materials, energy, and products in modern societies. The work programme of thematic area D sets forth the key goal of carrying out research and development work in ocean technology, with a view to scientific and commercial applications. At a technological level we strive to bring advances in robotics, communications, complex systems, and information theory to bear on the development of advanced marine systems and platforms that will afford marine scientists far more efficient tools than available today to study the ocean and its frontiers. Portugal holds the exclusive jurisdiction and economic rights of a large area of the Atlantic seafloor. A major goal is to increase the relatively limited national knowledge on marine resources and the functions and services of ocean and deep-sea ecosystems. In thematic area E the research work focuses on key issues of ecosystem functioning in a time of change, anthropogenic climate change, and the exploitation of ocean biotic and mineral resources. The latter activity includes bio-telemetry studies of top predators along with the mapping of key habitats; study of systems geochemistry and genesis, evolution, and utilization of the earth's crust, the Earth's surface to the ocean seafloor; experimental research in the areas of genomics, proteomics, immunology, ecological toxicology, molecular biology, physiology, and calcification processes; gene expression and physiological reactions in deep sea vent animals; husbandry and experimentation with deep-water corals . Under this thematic area, emphasis is given to the development and application of scientific knowledge on marine life conservation and sustainable use of living resources of the North Atlantic, including the slopes of the islands, deep sea, all adopting an open ocean ecosystem perspective.

**Breve descrição das actividades desenvolvidas bem como dos desvios ocorridos durante a execução do projecto**

During the period of 2013-14, LARSyS has continued developing research activities in the context of the different groups/units as well as in the framework of the thematic areas of the Associate Laboratory. These activities are described in detail in the following sections. In what follows we summarize the main highlights and indicators during the last two years. a) Key Achievements of the LARSyS Units during the 2013-14 Period The ISR/LARSyS has been involved in 9 EC FP7 projects (TRIDENT, MORPH, RoboSoM, HANDLE, FIRST-MM, Dicores, POETICON, 2 coordinated by ISR – RoCKIn and MONarCH) covering topics such as cooperative formation control of autonomous marine vehicles (AMVs), underwater mobile manipulation, humanoid navigation, coordination and grasping using vision and inertial sensors, robot competitions and interaction between human groups and a networked robot system; an ESA project MVFLAU using S-estimators applied to the real time estimation of inertia and center of mass of spacecrafts; and 14 national projects (including 1 OREN and 1 CMU-Portugal) covering topics such as video surveillance networks, managing the extended Portuguese continental platform, integration of EEG and fMRI data, with applications in epilepsy and motor activity, algorithms for Integrated Ultra Short Baseline and Inertial Navigation Systems with applications to AMVs, development and validation of filters for SLAM, with application to unmanned aerial vehicles and development of a new nonlinear filter structure for distributed underwater Terrain-Aided Navigation. These projects involve multiple groups within LARSyS and illustrate the visibility and the quality of the research work carried out by the LARSyS investigators. In the area of Industrial Ecology and Sustainability, IN /LARSyS has further developed the income approach to carbon, with worldwide calculations at the regional and country level. The Research Program on Urban Metabolism and Sustainable Cities (UMSC) was launched and advances were made in urban metabolism, with new applications in Asian and Latin American cities. Economic, environmental and social analysis of the impact of the Portuguese recycling sector was carried out. In the area of Thermofluids, Combustion and Energy Systems experiments addressed two-phase heat transfer in microchannels, pool boiling over micro structured surfaces, dynamics of the wettability of patterned and natural surfaces; Flame diagnostics, propagation and control; and Flame acoustics. In the area of Technology Policy and Management a new set of data was explored for the period 1970-2010 in Portugal. The results show the need to consider the co-evolution of brain gain, brain drain and brain circulation over time and space. In addition, the analysis focused on patterns of knowledge production and diffusion, looking specifically at the role of new technology based firms, towards revisited industrial policies. IMAR-Az/LARSyS has, under FP7 project MORPH, and in cooperation with ISR/IST, completed the first stage towards the joint development of a pioneer underwater robotic system based on the integration of multiple marine robotic nodes carrying different sensors and capabilities to map inaccessible habitats and biological communities of cold water-corals in vertical cliffs and overhangs. The concept of a seamount dedicated to science was consolidated. The seamount Condor observatory is now the only running experiment in the world of its kind, allowing a holistic study of seamount ecosystems. There is a special issue of the journal Deep-Sea Research II dedicated to this problem. LARSyS is involved in the international effort for defining the basic requirements for environmental assessment of deep-sea mining, being a WP coordinating partner at the FP7 project MIDAS. The research activities of CAMGSD/LARSyS developed along three main areas: Dynamical Systems; Geometry and Topology; and

NonLinear Analysis and Differential Equations. The contribution of this Center to the total number of publications by Portuguese researchers in international scientific journals in these areas continues to be very significant. During 2013-2014 the members of CAMGSD published 8 books or monographs, 184 articles in international scientific journals and 15 communications in refereed proceedings. In addition, 62 other submitted publications were accepted in international journals and will appear soon. Moreover the Center organized 19 international conferences and maintained 11 periodic seminars. M-ITI/LARSyS has deployed and evaluated several digital art installations to understand the possibilities of art in engaging people and raising awareness for sustainable behaviors. Also several publications report on the use of tangible games for promoting sustainable behavior and work with children in the education domain was developed aiming to foster sustainable values. At the technical level, several non-intrusive load monitoring and transportation sensors were tested in a real-world scenario to detect energy and transportation related behaviors. Work continued on the development of a distributed architecture for motor and cognitive neuro-rehabilitation (rehabNet) for the elderly. In the area of creative media, several digital art installations were deployed and tested in real-world scenarios. The MStoryG panel was installed in the airport of Madeira and tested with passengers to understand their adoption and engagement with repurposed technology. In 2013, M-ITI/LARSyS was awarded one of the first pilot EU grants for an ERA Chair in a total of funding of 2,35M€ for a period of 5 years (LEAPFROG HCI-DI). Our recruiting efforts led to the hiring of Christopher Csikszentmihályi, a leading researcher in HCI and Design Innovation known for developing political technologies that rebalance power between citizens, corporations, and governments. Creminer/LARSyS has focused, particularly, in the fields of (1) seabed mineral exploration; (2) study of mineral deposits on land, mostly, but not exclusively, on the Iberian Pyrite Belt; (3) on experimental development, with the stable isotope lab, and (4) on public outreach, where Centro Ciéncia Viva do Lousal stands out. Creminer members have completed extremely influential presentations, including in the most relevant scientific bodies and also in political organizations such as the European Parliament. b) Advanced training, community building and outreach Throughout this period, LARSyS has nurtured the dimension of advanced training as one of the pillars of its activities. This has been done at the MSc and (mostly) doctoral levels and includes the partnerships with the MIT, CMU, UTAustin and EPFL. In the period 2013-14, an outstanding number of 5 FCT Doctoral Schools with the LARSyS units acting as leaders in most cases, have been approved for funding: - "Robotics, Brain and Cognition" (ISR), - "Networked Interactive Cyber Physical Systems" (ISR and MITI), - "Sustainable Energy Systems" (IN), - "Digital Media" (MITI) - "Engineering Design and Advanced Manufacturing Systems" (IN). In 2013 and 2014, LARSyS organized its Annual Workshop, hosted at the Pavilhão do Conhecimento - Agéncia Ciéncia Viva, a very successful and lively event that gathered more than 100 researchers, doctoral students, international researchers and representatives from the industry and from LARSyS spinoff companies. The 2013 and 2014 Workshops have encompassed different types of sessions: (i) identification os strategic topics; (ii) interaction with industries and other stakeholders; (iii) innovation-oriented panels and discussions with spin-offs and (iv) scientific presentations and promotion of synergies amongst LARSyS researchers. c) Deviations from the original plan There are no major deviations relative to the plan foreseen initially. However it should be noted that the LARSyS FCT funding has been significantly reduced when compared to recent years. While this has not apparently had an immediate impact in several performance indicators, it has hampered the capacity to attract and sustain young researchers at the doctoral and post-doctoral levels and has created obstacles concerning the participation in international conferences and the possibility to purchase and maintain a sophisticated research infrastructure. In spite of the renovated effort to capture external funds by all LARSyS units and groups, we share the concern that such important and sudden reductions in the funding will undoubtedly impact negatively on LARSyS future research capacity and output.

### **Objectivos atingidos**

Altogether, the LARSyS objectives have been attained in the different units and research groups. In the period under consideration, LARSyS units have produced 63 Doctoral graduates and over 658 papers in prestigious international journals. We have now 5 international doctoral programs partially funded by FCT and involving premium universities like the MIT, CMU, UTAustin and EPFL. These programs demonstrate the commitment of LARSyS towards advanced training and international cooperation. During 2013-14, LARSyS has produced several key results as described in the sections dedicated to the detailed activities our groups and thematic areas but we have also strengthened our involvement with top international partners and the development of a cutting edge research infrastructure in the various areas. The unique multidisciplinary nature of LARSyS, including science, engineering and economic domains has produced many innovative research questions and results which are now paving the way for future collaborations and endeavours at the national and international levels.

### **Realização Financeira (Justificação sumária dos desvios ocorridos durante a execução do projecto)**

There were no major changes in the 2013-14 as compared with the approved proposal. However the unexpected cut in funding for the whole period that was communicated in the beginning of 2013, had a substantial impact on the hiring of new researchers and update of existing research infrastructures, in spite of the effort undertaken to secure additional research funds.

### **3. Instituições que Participam no Projecto**
